

Smart Class Platform – Observations

1. Student Management

- Currently, only the Head Teacher can add students.
- Teachers cannot directly add students to their own classes.
- Different classes may have different students, so this workflow feels restrictive.

2. User Registration Issue

- If a Head Teacher adds a student or teacher before they register on the platform, the user is unable to access the platform properly.
- The onboarding process appears dependent on the order of registration.

3. Content Visibility

- Students should only see content related to their assigned teacher and class.
- While exploring the platform, content segregation between classes and teachers did not appear fully isolated.

4. Lecture Processing Time

- Processing uploaded lecture recordings/videos takes a noticeable amount of time.
- There is currently limited visibility into the processing progress.

Overall Observation

The platform is functioning well and the overall concept is promising. The main observations are related to:

- Student management workflow
- User registration flow
- Content access and visibility
- Lecture processing performance

These observations are based on my exploration and testing of the current platform.
